EXECUTIVE SUMMARY

In accordance with the United States Environmental Protection Agency (EPA) Coal Combustion Residual (CCR) Rule (40 CFR Part 257, Subpart D) and Administrative Order No. 7010-19, this 2021 Annual Groundwater Monitoring and Corrective Action Report has been prepared to document semi-annual assessment groundwater monitoring activities at the Plant Watson former CCR Unit and to satisfy the requirements of § 257.90(e). Semi-annual assessment monitoring and associated reporting for Plant Watson former CCR Unit is performed in accordance with the monitoring requirements § 257.90 through § 257.95. The CCR unit began the monitoring period in assessment monitoring pursuant to § 257.95. Statistically significant increases (SSI) of Appendix III constituents over background were identified in the results of the first detection monitoring event, and assessment monitoring was initiated in August 2019.

The following summarizes activities for groundwater monitoring at the site during the 2021 monitoring period:

- Completed the Assessment of Corrective Measures on August 11, 2020 to address statistically significant levels (SSLs) observed in groundwater downgradient of the former CCR Unit, submitted the report to the Mississippi Department of Environmental Quality (MDEQ), and posted the report to the CCR compliance web page.
- Completed Alternate Source Demonstrations (ASDs) for barium (August 2020) and combined radium 226 + 228 (radium) (December 2020), submitted the ASDs to MDEQ, and posted to the CCR compliance web page.
- Submitted a plan to implement temporary groundwater corrective action and enhanced source control within the footprint of the former CCR Unit to MDEQ in December 2020. Approval was received from MDEQ in January 2021 to proceed with the temporary groundwater corrective action.
- Conducted the first and second semi-annual sampling event during November 2020 and March 2021 in all background, downgradient and surface water monitoring locations.

To meet the requirements of 40 CFR 257.90(e)(6), the Executive Summary Table – Monitoring Period Summary, describes the status of groundwater monitoring and corrective action during the monitoring period for this report.

The former CCR Unit concluded the monitoring period in assessment monitoring, and Mississippi Power Company (MPC) is evaluating potential groundwater remedies identified in the ACM report. The following monitoring-related activities are planned for the former CCR unit:

- Semi-annual groundwater assessment monitoring, including sampling of horizontal and vertical delineation locations.
- Continue to evaluate groundwater chemistry related to vertical delineation at the former CCR Unit.
- Continue evaluating corrective measures identified in the ACM, including evaluating if additional field data collection, laboratory studies, and/or field pilot tests are needed to support remedy selection.
- Initiating studies to evaluate natural attenuation mechanisms and capacity in Unit 3 for arsenic, lithium, and molybdenum. The attenuation study will evaluate the EPA-recommended tiered analysis approach to develop multiple lines of evidence for confirming the appropriate application of natural attenuation as a component of a corrective remedy strategy. The attenuation study is anticipated to include:
 - Aquifer matrix, groundwater, and surface water sampling;
 - Laboratory testing, which may include one or more of the following:
 - chemical and mineralogic characterization;
 - batch sorption/desorption testing; and/or
 - column testing; and
 - Data evaluation and documentation of the attenuation mechanisms.

1.0 INTRODUCTION

In accordance with the United States Environmental Protection Agency (EPA) Coal Combustion Residual (CCR) Rule (40 C.F.R. Part 257 Subpart D) and the Agreed Order Number (7010 19), this Annual Groundwater Monitoring and Corrective Action Report documents the groundwater monitoring activities completed from July 2020 through June 2021 at Mississippi Power Company's (MPC) Plant Jack Watson Electric Generating Plant (Plant Watson) Ash Pond (former CCR Unit). Semi-annual assessment monitoring and associated reporting for the former CCR Unit is performed in accordance with the monitoring requirements § 257.90 through § 257.95.

1.1 Site Description & Background

The former CCR Unit, ceased receiving CCR in April 2015 and closure was complete in May 2018. As part of closure, the former CCR Unit was dewatered sufficiently to remove the free water. The CCR material remaining in the former CCR Unit was graded and a final cover system installed. The final cover system consists of ClosureTurf cover system by WatershedGeo that utilizes a 50-mil linear low-density polyethylene (LLDPE) geomembrane overlain by an engineered synthetic turf. The cover system was constructed to control, minimize or eliminate, to the maximum extent feasible, the infiltration of water into the former CCR Unit by providing sufficient grades and slopes to promote surface runoff from the site. The permeability of the final cover system is less than the permeability of the natural soils beneath the surface impoundment and not greater than 1×10^{-5} centimeters/second (cm/s).

The former CCR Unit is inactive and ceased operation prior to April 17, 2015. A notification of intent to close the former CCR Unit was placed in the operating record on December 15, 2015 and posted to the internet within 30 days. The former CCR Unit was closed in May 2018 and the Certification of Closure was posted to the internet on June 4, 2018. Therefore, groundwater monitoring and reporting for the former CCR Unit is being completed in accordance with the alternate schedule in § 257.100(e)(5) of the revised CCR Rule (August 5, 2016) and the Agreed Order.

2.0 REGIONAL GEOLOGY & HYDROGEOLOGIC SETTING

2.1 Site Location and Physical Setting

Plant Watson is located in Harrison County within the City of Gulfport, Mississippi. The physical address of the plant is 10406 Lorraine Road, Gulfport, Mississippi 39503. The former CCR Unit is located southeast of the plant and west of the Biloxi River. **Figure 1, Site Location Map**, depicts the location of Plant Watson and former CCR Unit with respect to the surrounding area. Harrison County, Mississippi, lies within the Eastern Section of the Gulf Coastal Plain physiographic province (USGS, 1998). The topography of Harrison County is gently rolling to flat with elevations ranging from 200 feet (ft) above mean sea level (MSL) inland to approximately 0 ft MSL near the coastal waterbodies (USGS, 1985). Local site elevations near the former CCR Unit are between 25 and 5 ft MSL.

2.2 Geology and Hydrogeology

The subsurface geology at the site is characterized by deposits of clay, silt, and sand deposited between the Pliocene and Holocene series. This sequence of sediments has been subdivided, from oldest to youngest, into the units of Upper Graham Ferry Member of the Pensacola Formation, Citronelle Formation, Biloxi Formation, Prairie Formation, and Holocene coastal wetland, deltaic, and alluvium deposits (Otvos, 2001). The unconsolidated sediment at the site is underlain by Pliocene and Miocene sedimentary rocks at depths greater than -500 ft MSL (USGS, 1998; Hoffmann et al, 2017).

At the Site, four geologic units have been encountered surrounding and underlying the former CCR Unit and are described from shallowest to deepest as follows:

- Unit 1 is dike fill material comprising the dike along the perimeter of the former CCR Unit with a thickness ranging from 0 to 20 feet
- Unit 2 is a sandy clay to clay aquitard underlying the former CCR Unit. The unit corresponds to the Biloxi Formation and ranges from 5 to 20 feet thick. Permeability testing conducted on Unit 2 soils indicate a permeability in the 10^{-8} cm/s range.
- Unit 3 is a fluvial sand aquifer corresponding to the Citronelle Formation. The unit is approximately 40 feet thick. Unit 3 is the uppermost aquifer at the site for groundwater monitoring purposes.
- Unit 4 is a clay aquitard underlying the Unit 3 aquifer and is continuous across the site. Unit 4 corresponds to the Upper Graham Ferry Formation. Permeability testing conducted on Unit 4 clays, indicates a permeability in the 10^{-8} cm/s range.

All site monitoring wells are screened in the uppermost aquifer beneath the site in the Unit 3 sands corresponding to the Citronelle Formation. The Unit 3 sand aquifer is typically located at elevations between 0 and -42 ft MSL and generally consists of fine to coarse, well-graded sands with occasional lenses of clay and preserved wood fragments. Groundwater recharge to the uppermost aquifer in the area is largely through infiltration of precipitation.

A subsurface cement-bentonite wall was installed around the perimeter of the former CCR Unit to provide structural support of the soil dike between 1994 and 2000. The subsurface wall was installed to a common depth around the former CCR Unit. Although installed primarily for structural stability, the subsurface wall extends through much of Unit 3 and impedes groundwater flow within Unit 3 beneath the former CCR Unit. Unit 3 groundwater monitoring wells are installed outside of the subsurface wall.

3.0 GROUNDWATER MONITORING ACTIVITIES

In accordance with 40 CFR § 257.90(e), the following describes monitoring-related activities performed during the monitoring period and presents the status of the monitoring program. Groundwater sampling was performed in accordance with § 257.93. Samples were collected from each well in the certified monitoring system. The location of each of these monitoring wells is shown on **Figure 2, Monitoring Well Network**.

3.1 Groundwater Monitoring Network

To meet the performance standards of § 257.91(a), MPC installed a groundwater monitoring system consisting of wells at appropriate locations with screens in the uppermost aquifer. The number, spacing, and depths of the groundwater monitoring wells were selected based on the characterization of Site-specific hydrogeologic conditions and certified by a PE. **Table 1, Groundwater Monitoring Network Details**, summarizes the monitoring well construction details and design purpose for the former CCR Unit. Monitoring wells in the certified monitoring system are shown on **Figure 2**.

Pursuant to § 257.95(g)(1), additional monitoring wells were installed to characterize the vertical extent of GWPS exceedances identified during assessment monitoring. Surface water sampling locations were utilized to characterize the horizontal extent of GWPS exceedances at the former CCR Unit. Delineation wells are identified on **Figure 2** and detailed on **Table 1**. All delineation wells are sampled semi-annually as part of the semi-annual assessment groundwater monitoring program.

3.2 Assessment Monitoring

In accordance with § 257.94(b), eight independent samples were collected from each background and downgradient well and analyzed for the constituents listed in Appendix III and IV beginning March 2018 through February 2019, with additional wells extending to June 2019. Groundwater sampling for the first detection monitoring event after the background period was performed in April 2019.

Based on results presented in the *2019 Annual Groundwater and Corrective Action Monitoring Report*, MPC initiated an assessment monitoring program in August 2019. Pursuant to § 257.95(b) and within 90 days of initiating the assessment monitoring program, an initial assessment monitoring event was conducted August 8 through 9, 2019 and monitoring wells were sampled for all Appendix IV parameters. Pursuant to § 257.95(d)(1), semi-annual assessment monitoring events were conducted August 2019 and March 2020. During the semi-annual assessment monitoring event, monitoring wells were sampled for Appendix III parameters as well as Appendix IV parameters that were detected in the initial assessment event. **Table 2, Summary of Sampling Events**, presents a summary of groundwater sampling events and their purpose completed during the semi-annual assessment monitoring events conducted in November 2020 and March 2021.

Analytical data from the semi-annual groundwater monitoring events conducted in November 2020 and March 2021 are included in **Appendix A, Groundwater Analytical Data**.

4.0 GROUNDWATER SAMPLING METHODOLOGY AND ANALYSIS

Sampling events completed for the former CCR Unit represent both the annual initial Appendix IV monitoring event as well as the 2 subsequent semi-annual assessment monitoring events. The following describes the methods used to conduct groundwater monitoring at the former CCR Unit.

4.1 Groundwater Elevation Measurement

Prior to each sampling event, groundwater levels were measured and recorded to the nearest 0.01 feet within a 24-hour period. Each well was opened and allowed to equilibrate to atmospheric pressure prior to measuring groundwater levels. Depths are referenced from the top of the well casing. Groundwater elevations are calculated by subtracting the depth to groundwater from surveyed top of casing (TOC) elevations.

Groundwater elevations fluctuate in response to rainfall and tides. Seasonal variations of 1.5 to 2.5 feet are typical at the site. **Table 3, Summary of Groundwater Elevations**, provides a summary of water level data for the site observed in the semi-annual assessment monitoring events conducted in November 2020 and March 2021.

Groundwater elevation data from the initial assessment, and semi-annual assessment monitoring events were used to develop the potentiometric surface elevation contour map provided as **Figure 3, Unit 3 Potentiometric Surface Contour Map – November 3, 2020** and **Figure 4, Unit 3 Potentiometric Surface Contour Map - March 12, 2021**. As shown on these figures, the general direction of groundwater flow is from west to east and radially from the former CCR Unit. Groundwater elevations and flow patterns are generally consistent across the monitoring events.

4.2 Groundwater Sampling

Groundwater samples were collected in accordance with § 257.93(a). Each of the monitoring wells at the former CCR Unit is equipped with a dedicated bladder pump. For wells without dedicated pumps, a peristaltic pump along with disposable polyethylene tubing was used to purge and sample from the middle of the well screen interval.

Monitoring wells were purged and sampled using low-flow sampling procedures whereby samples are collected when field water quality parameters (pH, turbidity, conductivity, and dissolved oxygen) were measured to determine stabilization. A SmarTroll (In-Situ field instrument) was used to monitor and record field water quality parameters for stabilization during well purging. Turbidity was measured in the field with a portable turbidimeter. Groundwater samples were collected when the following stabilization criteria were met:

- 0.1 standard units for pH
- 5% for specific conductance
- 0.2 milligrams per liter (mg/L) or 10% for DO > 0.5 mg/l (whichever is greater)
- Turbidity measurements less than 5 nephelometric turbidity units (NTU)

- Temperature and oxidation reduction potential (ORP) – record only, no stabilization criteria

Once stabilization was achieved, samples were collected directly into appropriately preserved laboratory-supplied sample containers and placed in iced coolers and submitted to Eurofins Test America, Inc. (Eurofins) following chain-of-custody protocol.

4.3 Laboratory Analysis

Laboratory analyses were performed by Eurofins in Pensacola, Florida; Pittsburg, Pennsylvania; and St. Louis, Missouri. The Eurofins locations are accredited by National Environmental Laboratory Accreditation Program (NELAP) and maintain a NELAP certification for all parameters analyzed. Analytical methods used for groundwater sample analysis and chain-of-custody records for each monitoring event are presented in **Appendix A**.

4.4 Quality Assurance/Quality Control

During each sampling event, quality assurance/quality control (QA/QC) samples were collected at a rate of one sample per every 10 detection samples. Equipment blanks and duplicate samples were also collected during each sampling event. QA/QC sample data was evaluated during data validation and is included in **Appendix A**.

Background and detection monitoring groundwater quality data were independently validated following guidance from the EPA Region IV Environmental Investigations Standard Operating Procedures and Quality Assurance Manual (November 2001); the EPA Region IV Data Validation Standard Operating Procedures (US EPA Region IV, September 2011); and the analytical methods. Data validation consisted of reviewing sample integrity, holding times, laboratory method blanks, laboratory control samples, matrix spikes/matrix spike duplicate recoveries and relative percent differences (RPDs), post digestion spikes, laboratory and field duplicate RPDs, field and equipment blanks, and reporting limits. A narrative providing the results of the data validation is provided in **Appendix A**.

5.0 STATISTICAL ANALYSIS

Statistical analysis of Appendix III and IV groundwater monitoring data was performed on samples collected from the certified groundwater monitoring network pursuant to § 257.93 following the PE-certified statistical method for the former CCR Unit. The statistical method used at the site was developed by Groundwater Stats Consulting, LLC. (GSC), in accordance with §257.93(f) using methodology presented in *Statistical Analysis of Groundwater Data at RCRA Facilities, Unified Guidance*, March 2009, EPA 530/R-09-007 (USEPA, 2009).

5.1 Statistical Methods

The Sanitas groundwater statistical software was used to perform the statistical analyses. Sanitas is a decision support software package that incorporates the statistical tests required of Subtitle C and D facilities by USEPA regulations. Statistical analysis was performed using methods described in the PE-certified statistical analysis plan for the site.

5.1.1 Appendix III Statistical Method

Interwell prediction limits (PL), combined with a 1-of-2 verification resample plan is the statistical method used to evaluate the groundwater monitoring data at the former CCR Unit. Interwell PLs pool upgradient well data to establish a background limit for an individual constituent. This method is appropriate where there is no significant variability in the data to be pooled as determined using an Analysis of Variability (ANOVA) test. The most recent sample from each downgradient well is compared to the background limit to identify statistically significant increases (SSIs) over background.

If data from a detection monitoring sampling event initially exceed the PL, the resampling strategy may be used to verify the result within 90 days. If the resample exceeds the PL, the initial exceedance is verified, and an SSI of that Appendix III parameter is determined. When the resample result does not verify the initial result, the initial exceedance is considered an erroneous result and the resample value will replace the initial result. If resampling is not conducted the initial exceedance is verified.

5.1.2 Appendix IV Statistical Method

When in assessment monitoring, Appendix IV constituents are statistically compared to groundwater protection standard (GWPS). Following the Unified Guidance, spatial variation for Appendix III parameters is tested using the ANOVA – this test is not prescribed for Appendix IV constituents. Unlike the statistical evaluation of Appendix III constituents (where single-sample results are compared to the statistical limit), Appendix IV analysis uses the pooled results from each downgradient well to develop a well-specific confidence interval that is compared to the statistical limit. The statistical limit is either the interwell tolerance limit (i.e., background) calculated using the pool of all available upgradient well data, or an applicable groundwater protection standard. Appendix IV background data are screened for outliers and extreme trending

patterns that would lead to artificially elevated statistical limits. Parametric tolerance limits (i.e. UTLs) were calculated using pooled upgradient well data for Appendix IV parameters with a target of 95% confidence and 95% coverage. The confidence and coverage levels for nonparametric tolerance limits are dependent upon the number of background samples. The UTLs were then used as the GWPS.

As described in § 257.95(h)(1)-(3), the GWPS is:

- (1) The MCL established under 40 CFR § 141.62 and 141.66.
- (2) Where an MCL has not been established:
 - (i) Cobalt 0.006 mg/L;
 - (ii) Lead 0.015 mg/L;
 - (iii) Lithium 0.040 mg/L; and
 - (iv) Molybdenum 0.100 mg/L.
- (3) Background levels for constituents where the background level is higher than the MCL or rule specified GWPS.

In assessment monitoring, when the lower confidence limit (LCL), or the entire confidence interval, exceeds the GWPS as discussed in the USEPA Unified Guidance, the result is recorded as a statistically significant level (SSL) over the GWPS. **Table 4, Summary of Background Levels and Groundwater Protection Standards** summarizes the background limit established at each monitoring well and the GWPS.

5.2 Statistical Analysis Results

Appendix III and IV analytical data from the November 2020 and March 2021 semi-annual monitoring events was statistically analyzed in accordance with the PE-certified Statistical Analysis Plan. Appendix III statistical analysis was performed, and constituents have not returned to background levels. Appendix IV assessment monitoring parameters were evaluated using confidence intervals to determine if concentrations statistically exceeded the established GWPS.

5.2.1 First Semi-Annual Assessment Monitoring Event

Statistical analysis of Appendix IV data identified the following SSLs over GWPS as follows:

- Arsenic: APMW-3, APMW-4, APMW-5, APMW-6R, APMW-8, and APMW-10
- Barium: APMW-2
- Radium: APMW-1R, APMW-2, APMW-3, APMW-7, and APMW-9
- Lithium: APMW-3, APMW-4, APMW-5, APMW-6R, and APMW-8
- Molybdenum: APMW-6R and APMW-8

Confidence intervals, time series plots, and box plots are provided in **Appendix B - Statistical Analyses**. Time-series plots were used to evaluate concentrations in wells and to visually compare concentrations in downgradient wells to those in background wells.

As discussed in Section 6.0 of this report, ASDs have been prepared to address the SSLs for barium and radium.

5.2.2 Second Semi-Annual Assessment Monitoring Event

Statistical analysis of Appendix IV data identified the following SSLs over GWPS as follows:

- Arsenic: APMW-3, APMW-4, APMW-5, APMW-6R, APMW-8, and APMW-10
- Barium: APMW-2
- Radium: APMW-1R, APMW-2, APMW-3, APMW-7, and APMW-9
- Lithium: APMW-3, APMW-4, APMW-5, APMW-6R, and APMW-8
- Molybdenum: APMW-6R and APMW-8

Confidence intervals, time series plots, and box plots are provided in **Appendix B**. Time-series plots were used to evaluate concentrations in wells and to visually compare concentrations in downgradient wells to those in background wells.

As discussed in Section 6.0 of this report, ASDs have been prepared to address the SSLs for barium and radium.

5.2.3 Delineation Wells

To evaluate delineation efforts groundwater quality is simply compared to the GWPS. Surface water sampling locations serve as the basis for horizontal delineation in the direction of groundwater flow, and additional wells with a “D” designation were installed for downward vertical delineation.

A review of analytical data for samples from vertical delineation wells identified the following GWPS exceedances during the first semi-annual sampling event:

- Arsenic: APMW-5D, APMW-10D
- Lithium: APMW-4D
- Molybdenum: APMW-4D, APMW-10D

During the second semi-annual sampling event, the following GWPS exceedances were observed in the vertical delineation wells:

- Arsenic: APMW-5D, APMW-10D
- Lithium: APMW-4D
- Molybdenum: APMW-4D

Analytical results from vertical delineation wells identified concentrations above GWPS of Appendix IV constituents and vertical delineation is ongoing.

Analytical results from horizontal sampling locations did not identify concentrations above GWPS of Appendix IV constituents; therefore, horizontal delineation is complete at the former CCR Unit.

6.0 ALTERNATE SOURCE DEMONSTRATIONS

In accordance with 40 CFR § 257.95(g)(3)(ii), 2 separate ASDs were prepared and submitted to MDEQ to address SSLs of barium and radium. The ASD for barium was completed on August 1, 2020, and the ASD for radium completed on December 8, 2020. The barium and radium ASDs are included in **Appendix C, Alternate Source Demonstrations**.

Information presented in the ASDs explains that a source other than the CCR unit caused the SSLs of barium and radium: they are naturally occurring in groundwater at the Site and are not the result of a release from the former CCR Unit. Based on the ASDs, MPC is proposing to exclude barium and radium from the corrective measures evaluation currently underway at the Site.

7.0 MONITORING PROGRAM STATUS

This site is currently in assessment monitoring and evaluating groundwater corrective action alternatives. Statistical evaluations of the groundwater monitoring data for the former CCR Unit identified SSIs of Appendix III and SSLs of Appendix IV groundwater monitoring parameters. . MPC has initiated an ACM pursuant to § 257.95(g)(3)(i) and the Agreed Order. The ACM was completed by August 11, 2020 and posted to the operating record.

8.0 CONCLUSIONS AND FUTURE ACTIONS

Based on the results reported in the *2019 Annual Groundwater Monitoring and Corrective Action Report*, MPC initiated an assessment monitoring program. An ACM was completed on August 11, 2020 to address SSLs of Appendix IV above groundwater protection standards pursuant to 40 CFR § 257.95(g)(5). This *Groundwater Monitoring and Corrective Action Report* has been prepared to fulfill the requirements of USEPA CCR rule 40 CFR 257 Subpart D. Semi-annual assessment monitoring events took place in November 2020 and March 2021. Statistical evaluations of the assessment monitoring data identified SSLs of Appendix IV constituents above the GWPS. The Site remains in assessment monitoring while groundwater corrective remedies are being evaluated. Additional monitoring wells were installed to assess the horizontal and vertical extent of groundwater impacts at the site.

An ASD has been prepared to address SSLs of barium and radium. MPC will continue to characterize the nature and extent of GWPS exceedances for arsenic, lithium, and molybdenum as required by § 257.95(g)(1) and the Agreed Order and report result pursuant to the Agreed Order and § 257.90(e)(3).

The following future actions are planned during the next 12 months at the Site:

- Semi-annual groundwater assessment monitoring, including sampling of horizontal and vertical delineation locations.
- Continue to evaluate vertical delineation of GWPS exceedances.
- Evaluate potential groundwater remedies identified in the ACM report and provide required semi-annual status reports.
- Initiate studies to evaluate natural attenuation mechanisms and capacity in Unit 3 for arsenic, lithium, and molybdenum.
- Design, install, and test groundwater extraction wells for the temporary groundwater remedy and enhanced source control.
- Submit the next Semi-Annual Remedy Selection and Design Progress Report by September 30, 2021.
- Submit the next Semi-Annual Progress Report by September 30, 2021.
- Submit the next Annual Groundwater and Corrective Action Report by August 1, 2022.

Comments

No additional comments.

Receipt

The samples were received on 11/6/2020 9:00 AM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 1.9° C, 2.4° C and 3.4° C.

Receipt Exceptions

The volume in the 500mL unpreserved containers for the following samples is much darker than the other containers. APMW-15 (180-113329-7) and DUP-01 (180-113329-9)

GC Semi VOA

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals

Method 6020B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 180-337962 and analytical batch 180-338293 were outside control limits for selenium. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

HPLC/IC

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Receipt

The samples were received on 11/6/2020 9:00 AM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 1.9° C, 2.4° C and 3.4° C.

RAD

Method 9315: 9315 Prep Batch 488997

The following sample has a barium carrier recovery above the 110% QC limit; Affected samples had a barium correction applied, however, there is significant concentrations of salt-like compounds (i.e. calcium, magnesium, sodium, and strontium) that can interfere with a barium sulfate recovery. The LCS (laboratory control sample) has an acceptable spike recovery demonstrating acceptable sample preparation and instrument performance. The samples have been truncated to 100% to reduce any potential bias a high carrier recovery may have. The data have been qualified and reported. APMW-1R (180-113329-1) and DUP-03 (180-113329-11)

Method 9315: 9315 Prep Batch 160-488997

The following sample(s) have Barium carrier recoveries above the 110% QC limit; The sample is a field blank therefore there is no matrix affect. The sample met the detection goal and was ND indicating no adverse affect from the carrier discrepancy. Additionally the LCS/LCSD (laboratory control sample/laboratory control sample duplicate) have acceptable spike recoveries demonstrating acceptable sample preparation and instrument performance. The sample(s) have been truncated to 100% to reduce any potential bias a high carrier recovery may have. The data have been reported with this narrative. FB-01 (180-113329-12)

Method 9315: 9315 prep batch 488997

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. APMW-1R (180-113329-1), APMW-2 (180-113329-2), APMW-2D (180-113329-3), APMW-3 (180-113329-4), APMW-13 (180-113329-5), APMW-14 (180-113329-6), APMW-15 (180-113329-7), APMW-16 (180-113329-8), DUP-01 (180-113329-9), DUP-02 (180-113329-10), DUP-03 (180-113329-11), FB-01 (180-113329-12), EB-01 (180-113329-13), (LCS 160-488997/1-A), (LCSD 160-488997/2-A) and (MB 160-488997/21-A)

Method 9320: 9320 160-488998

The LCS recovered at (71%) for (Ra228). The limits in our LIMS system at 75-125 reflect the requirements of a regulatory agency that represents a large amount of our work. However the samples associated with this LCS are not from this agency and are therefore held to our in-house statistical limits of (58-151%) per method requirements. Although there is a qualifier, the LCS passes. No further action is required (LCS 160-488998/1-A)

Method 9320: Radium-228 Prep Batch 488998

The following sample has a barium carrier recovery above the 110% QC limit; Affected samples had a barium correction applied, however, there is significant concentrations of salt-like compounds (i.e. calcium, magnesium, sodium, and strontium) that can interfere with a barium sulfate recovery. The LCS (laboratory control sample) has an acceptable spike recovery demonstrating acceptable sample preparation and instrument performance. The samples have been truncated to 100% to reduce any potential bias a high carrier recovery may have. The data have been qualified and reported. APMW-1R (180-113329-1) and DUP-03 (180-113329-11)

Method 9320: 9320 160-488998

The following sample(s) have (Barium carrier) recoveries above the 110% QC limit; This is a discrepancy that is not related to matrix due to the sample being a field blank. The LCS/LCSD (laboratory control sample/laboratory control sample duplicate) have acceptable spike recoveries demonstrating acceptable sample preparation and instrument performance. The sample achieved the detection goal and was ND as would be excepted from a field or equipment blank indicating no adverse affect from the discrepancy. The sample(s) have been truncated to 100% to reduce any potential bias a high carrier recovery may have. The data have been reported with this narrative. FB-01 (180-113329-12)

Receipt

The samples were received on 11/12/2020 9:00 AM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 2.4° C, 2.7° C and 3.9° C.

Receipt Exceptions

The following samples were listed on the Chain of Custody (COC); however, no samples were received: APMW-6R (180-113523-7), DUP-04 (180-113523-8), FB-02 (180-113523-9), EB-03 (180-113523-10), EB-02 (180-113523-16), APMW-12 (180-113523-18), APMW-10 (180-113523-19), APMW-10D (180-113523-20), APMW-9 (180-113523-21)

The container label for the following sample did not match the information listed on the Chain-of-Custody (COC): FB-03 (180-113523-11). The container labels list a sample collection time of 08:55, while the COC lists 09:00. The collection time on the COC was used.

GC Semi VOA

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals

Method 6020B: The following sample was diluted to bring the concentration of boron to within the instrument's linear range: APMW-8 (180-113523-22). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Receipt

The samples were received on 11/12/2020 9:00 AM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 2.4° C, 2.7° C and 3.9° C.

Receipt Exceptions

The following samples were listed on the Chain of Custody (COC); however, no samples were received: APMW-6R (180-113523-7), DUP-04 (180-113523-8), FB-02 (180-113523-9), EB-03 (180-113523-10), EB-02 (180-113523-16), APMW-12 (180-113523-18), APMW-10 (180-113523-19), APMW-10D (180-113523-20), APMW-9 (180-113523-21)

The container label for the following sample did not match the information listed on the Chain-of-Custody (COC): FB-03 (180-113523-11). The container labels list a sample collection time of 08:55, while the COC lists 09:00. The collection time on the COC was used.

RAD

Methods 903.0, 9315: Radium-226 prep batch 160-490326:

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. APMW-3D (180-113523-1), APMW-4 (180-113523-2), APMW-4D (180-113523-3), APMW-5 (180-113523-4), APMW-5D (180-113523-5), APMW-6D (180-113523-6), FB-03 (180-113523-11), APMW-5D FF (180-113523-12), APMW-8D (180-113523-13), DUP-05 (180-113523-14), APMW-7 (180-113523-15), APMW-11 (180-113523-17), APMW-8 (180-113523-22), (LCS 160-490326/1-A), (LCSD 160-490326/2-A) and (MB 160-490326/23-A)

Receipt

The samples were received on 11/21/2020 10:45 AM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.2° C and 3.8° C.

GC Semi VOA

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Metals

Methods 200.8, 6020B: The low level initial calibration verification (ICVL) associated with batch 180-338625 recovered above the upper control limit tin. The samples associated with this ICVL were non-detects -or- less than the RL for the affected analytes; therefore, the data have been reported.

Method 6020B: The following sample was diluted to bring the concentration of target analytes within the calibration range: APMW-6R (180-113974-1). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

RAD

Method 9315: 9315 prep batch 490915

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. APMW-12 (180-113974-5), DUP-04 (180-113974-6), FB-02 (180-113974-7), EB-02 (180-113974-8), EB-03 (180-113974-9), (LCS 160-490915/1-A), (LCSD 160-490915/2-A) and (MB 160-490915/23-A)

Methods 903.0, 9315: 903 / 9315 prep batch 490793

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. Methods 904.0, 9320: 904/9320 prep batch 490801

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. APMW-6R (180-113974-1), APMW-9 (180-113974-2), APMW-10 (180-113974-3), APMW-10D (180-113974-4), (LCS 160-490801/1-A) and (MB 160-490801/24-A)

Method 9320: 9320 Prep Batch: 160-490918

The LCS/LCSD recovered at (LCS-135% LCSD-136%) for Ra228. The limits in our LIMS system at 75-125 reflect the requirements of a regulatory agency that represents a large amount of our work. However the samples associated with this LCS are not from this agency and are therefore held to our in-house statistical limits of (58-151%) per method requirements. Although there is a qualifier, the LCS passes. No further action is required. (LCS 160-490918/1-A) and (LCSD 160-490918/2-A)

Metals

Method 6020: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 400-508920 and analytical batch 400-509092 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 6020: CRI recovery outside SOP's criteria (158%). The sample is ND; therefore data is report. (CRI 400-509092/12)

Method 6020: The method blank for preparation batch 400-508920 and analytical batch 400-509092 contained Arsenic above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 6020: The post digestion spike % recovery for Calcium, Barium and Magnesium associated with batch 400-509092 was outside of control limits. The associated sample is: (400-194806-F-27-A PDS).

Method 6020: The continuing calibration verification (CCV) associated with batch 400-509092 recovered above the upper control limit for Beryllium. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCV 400-509092/144).

Method 6020: The continuing calibration verification (CCV) associated with batch 400-509241 recovered above the upper control limit for Beryllium, Dissolved The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated sample is impacted: (CCV 400-509241/71).

Method 6020: CRI recovery outside SOP's criteria (167%). The sample is ND; therefore data is report. (CRI 400-509632/12)

Method 6020: The continuing calibration verification (CCV) associated with batch 400-509632 recovered above the upper control limit for Boron .The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: (CCV 400-509632/38) and (CCV 400-509632/50).

Method 6020: The continuing calibration verification (CCV) associated with batch 400-509632 recovered above the upper control limit for Selenium. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: (CCV 400-509632/149) and (CCV 400-509632/156).

Method 6020: The ICV for batch 400-509890 passed recovery/accuracy criteria which serves the ICV purpose of verifying the calibration standards. The replicate RSD for the elements were outside of the criteria for standards but within the criteria for field samples. Data has therefore been reported and narrated accordingly. (ICV 400-509890/14)

Method 6020: The ICV for batch 400-510079 passed recovery/accuracy criteria which serves the ICV purpose of verifying the calibration standards. The replicate RSD for the elements were outside of the criteria for standards but within the criteria for field samples. Data has therefore been reported and narrated accordingly. (ICV 400-510079/13)

Method 6020: The method blank/ICB/CCB for preparation batch 400-509021 and analytical batch 400-510079 contained Arsenic above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 6020: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 400-509021 and analytical batch 400-510079 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 6020: CRI recovery outside SOP's criteria (Arsenic, 229% and Thallium, 223%). The sample is either ND, below the PQL/RL or 10x the CRI; therefore data is report. (CRI 400-510209/11)

Method 6020: The following samples were diluted due to the nature of the sample matrix: SW-16-1.5FT-FF (400-194965-40),

Metals

Qualifier	Qualifier Description
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC is outside acceptance limits.
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
B	Compound was found in the blank and sample.
F1	MS and/or MSD recovery exceeds control limits.
F2	MS/MSD RPD exceeds control limits
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
U	Indicates the analyte was analyzed for but not detected.

Method 9315: Prep Batch 160-487779. The following sample did not meet the requested limit (RL) due to the low carrier recovery due to the presence of matrix interferences. The data have been reported with this narrative. SW-5-13FT-FF (400-194965-18)

Method 9315: Prep batch 160-487779. The Barium carrier recovery is outside the lower control limit (40%) for the following samples: SW-4-1.5FT (400-194965-13), SW-5-13FT (400-194965-17) and SW-5-13FT-FF (400-194965-18). There was physical evidence of matrix interference apparent during the initial preparation of the sample. The QC samples associated with the batch have acceptable carrier recovery indicating the presence of matrix interference.

Method 9315: Prep batch 160-487779. Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative. Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date. Method 9320: Radium-228 Batch 160-502092

The LCS recovered at 131% for Radium-228 Batch 160-502092. The limits in our LIMS system at (75-125%) reflect the requirements of a regulatory agency that represents a large amount of our work. However the samples associated with this LCS are not from this agency and are therefore held to our in-house statistical limits of (61-138%) per method requirements. The LCS passes. No further action is required.

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Method PrecSep_0: Radium 228 Prep Batch 160-502092:

The following samples were prepared at a reduced aliquot due to [describe sample]: APMW-15 (180-118143-12) and APMW-16 (180-118143-13). A laboratory control sample/ laboratory control sample duplicate (LCS/LCSD) were prepared instead of a sample duplicate (DUP) to demonstrate batch precision. Samples 180-118143-12 and 180-118143-13 were yellow in appearance and produced a strong odor. Sample 240-145656-1 was cloudy. Sample 240-145656-4 was brown and cloudy.

Receipt

The samples were received on 4/14/2021 9:00 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 14 coolers at receipt time were 2.3° C, 2.4° C, 2.6° C, 2.6° C, 2.7° C, 2.8° C, 2.9° C, 3.4° C, 3.6° C, 3.6° C, 3.7° C, 3.7° C, 3.7° C and 3.8° C.

GC Semi VOA

Method 300.0: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for analytical batch 180-353596 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 300.0: The matrix spike and matrix spike duplicate (MS/MSD) recoveries for the following sample associated with analytical batch 180-353597 were low outside control limits for Chloride in the MS and high outside control limits for Fluoride: (180-119924-C-37 MS) and (180-119924-C-37 MSD). The associated laboratory control sample (LCS) recovery met acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

Method 7470A: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 180-354215 and analytical batch 180-354475 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 7470A: The method blank for preparation batch 180-354242 contained mercury above the reporting limit (RL). None of the samples associated with this method blank contained the target compound; therefore, re-extraction and/or re-analysis of samples were not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

Method SM 2320B: The low-level laboratory control sample (LLCS) for analytical batch 180-357261 recovered outside control limits for the following analytes: Alkalinity. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

Method SM 2320B: Due to a software glitch the correct concentration for Alkalinity for the affected samples could not be determined. The results reported are biased high for the following samples: (LLCS 180-357261/76)

Method SM 2320B: Due to a software glitch the correct concentration for Alkalinity for the low-level laboratory control sample (LLCS) associated with the following samples could not be determined. The associated laboratory control sample (LCS) met acceptance criteria. SW-9-4' (180-119924-25), SW-9-4' FF (180-119924-26), SW-10-2' (180-119924-27), SW-10-2' FF (180-119924-28), SW-11-1' (180-119924-29), SW-11-1' FF (180-119924-30), SW-12-1' (180-119924-31), SW-12-1' FF (180-119924-32), SW-13-1' (180-119924-33), SW-13-1' FF (180-119924-34), SW-14-1.5" (180-119924-35), SW-14-1.5" FF (180-119924-36), SW-15-1.5" (180-119924-37), SW-15-1.5" FF (180-119924-38) and SW-16-1.5" (180-119924-39)

Method SM 2320B: The low-level laboratory control sample (LLCS) for analytical batch 180-357261 recovered outside control limits for the following analytes: Alkalinity. The samples were outside of the analytical holding time and were not reanalyzed. The results may be biased high.

Method SM 2320B: Due to a software glitch the correct concentration for Alkalinity for the affected samples could not be determined. The results reported are biased high for the following samples: (LLCS 180-357758/4)

Method SM 2320B: Due to a software glitch the correct concentration for Alkalinity for the associated low-level laboratory control sample

Methods 904.0, 9320: Radium-228 160-506772

The laboratory control sample and duplicate (LCS, LCSD) associated with the following samples recovered at 131% and 127% SW-17-1' FF (180-119924-42), DUP-01-FF (180-119924-44), DUP-02-FF (180-119924-46), DUP-03-FF (180-119924-48), (LCS 160-506772/1-A), (LCSD 160-506772/2-A) and (MB 160-506772/23-A). The limits in our LIMS system at 75-125% reflect the requirements of a regulatory agency that represents a large amount of our work. However the samples associated with this LCS are not from this agency and are therefore held to our in-house statistical limits of 61-138 per method requirements. The LCS and LCSD is within criteria and no further action is required.

GROUNDWATER STATS CONSULTING

Attn: Ms. Lauren Parker

Re: Plant Watson Ash Pond
Statistical Analysis – November 2020

Dear Ms. Parker,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical analysis of data for the November 2020 sample event for Mississippi Power Company's Plant Watson Ash Pond. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015) and follows the USEPA Unified Guidance (2009).

Sampling began for the CCR program in April 2018 for wells listed below and at least 8 background samples have been collected. Exceptions to this include newer upgradient wells APMW-11 and APMW-12, and downgradient well APMW-1R which is a replacement well for well APMW-1. Sampling began at these wells in March 2019. Additionally, sampling began in April 2019 for downgradient well APMW-6R which is a replacement well for APMW-6. New upgradient wells APMW-13, APMW-14, APMW-15, and APMW-16 were first sampled in July 2020 and again in November 2020 for a maximum of 2 sample events. As requested by Southern Company Services, upgradient wells with 2 or more samples will be incorporated into statistical analyses.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** APMW-11, APMW-12, APMW-13, APMW-14, APMW-15, and APMW-16

- **Downgradient wells:** APMW-1R, APMW-2, APMW-3, APMW-4, APMW-5, APMW-6R, APMW-7, APMW-8, APMW-9, APMW-10

Additionally, sampling at the following delineation wells listed below began in July 2020:

- **Delineation wells:** APMW-2D, APMW-3D, APMW-4D, APMW-5D, APMW-6D, APMW-8D, and APMW-10D

While data for these wells are plotted on the time series graphs and box plots, no formal statistics are included in this report due to the limited data. When a minimum of 4 samples is available, data from these wells will be evaluated using confidence intervals for the Appendix IV constituents.

The CCR program consists of the following constituents:

- **Appendix III** (Detection Monitoring) - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Appendix IV** (Assessment Monitoring) – antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Time series plots and box plots are included for all constituents at upgradient and downgradient wells. The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells.

Data at all wells were evaluated in April 2019 for the following: 1) outliers; 2) trends; 3) most appropriate statistical method for Appendix III parameters based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Interwell prediction limits were selected as the most appropriate statistical method to evaluate the Appendix III parameters at this site. Power curves were submitted at that time and demonstrated that the selected statistical methods for Appendix III parameters comply with the USEPA Unified Guidance. The EPA suggests the selected statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations.

During this analysis, all upgradient well data were reviewed for any new outliers in existing and new wells using the time series graphs. No additional values were flagged as outliers in existing upgradient wells, and none were flagged in the new upgradient wells due to

the limited data at this time. It was noted that concentrations for boron, calcium, chloride, and TDS in the new upgradient wells are similar across the new wells, but significantly higher than those observed in the existing upgradient wells. Further studies beyond the scope of this analysis would be needed to fully understand the groundwater population upgradient of the ash pond, and the appropriateness of pooling all upgradient well data for construction of prediction limits. The assumption, however, is that pooling all upgradient well data results in statistical limits that are representative of the entire background population and will serve to balance the false positive risk (identifying a problem in a downgradient well when none exists) with the false negative risk (not identifying impacts when they exist in a downgradient well).

Evaluation of Appendix III Parameters – November 2020

Interwell prediction limits, combined with a 1-of-2 resample plan, were constructed for all Appendix III constituents--boron, calcium, chloride, fluoride, pH, sulfate, and TDS--using all available upgradient well data through November 2020 to develop background limits. The most recent observation at each downgradient well is compared to its respective background limit during each subsequent semi-annual sampling event.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). If a resample falls within the statistical limit, the initial exceedance is considered to be a false positive result and, therefore, no further action is necessary.

During the background screening conducted in April 2019, Tukey's box plot method was used to screen for outliers and the findings were submitted at that time. When any values are flagged in the database as outliers, they are plotted in a disconnected and lighter symbol on the time series graph and the accompanying data pages display the flagged value in a lighter font. A summary of flagged values also follows this letter. A substitution of the most recent reporting limit was applied when varying detection limits existed in data. Note that for fluoride, the most recent detection limit in some of the downgradient wells of 5.0 mg/L, when substituted for nondetects in all wells, would result in a prediction limit that is higher than most of the detected values in both upgradient and downgradient wells. Therefore, the historical detection limit of 2 mg/L was substituted at all wells. This will be re-evaluated during the next background update.

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. The confidence levels associated with parametric prediction limits are based on an overall false positive rate of 5% due to semi-annual sampling. When data cannot be normalized or the majority of data are nondetects, a nonparametric test is utilized where the highest background value is used to establish the upper prediction limit (and lowest value in the case of pH). The associated confidence level is dependent on the number of available background, future comparisons and resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (USEPA Unified Guidance, 2009), data are analyzed using either parametric or non-parametric prediction limits.

- No statistical analyses are required on wells and analytes containing 100% nondetects.
- When data contain <15% nondetects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for nondetects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% nondetects, the Kaplan-Meier nondetect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% nondetects.

When interwell prediction limits were constructed based on the interwell methods discussed above, several statistically significant increases were identified. Summary tables of the prediction limit findings follow this letter.

The Sen's Slope/Mann Kendall trend test was performed on wells/constituents with prediction limit exceedances. Existing upgradient wells were included in this analysis for a general comparison of how the groundwater behaves upgradient of the facility relative to downgradient. The trend test requires a minimum of 5 samples. When the entire record of data was evaluated for each well discussed above, no statistically significant increasing trends were noted at any of the downgradient wells. Statistically significant decreasing trends were noted for boron and calcium in downgradient well APMW-4, and pH in upgradient well APMW-11. A summary of these findings follows this letter.

Evaluation of Appendix IV Parameters – November 2020

Data from upgradient wells for Appendix IV parameters are reassessed for outliers during each analysis and no new outliers were flagged at this time. A summary of previously flagged outliers follows this report.

Parametric upper tolerance limits were used to calculate background limits, when data followed a normal distribution, from pooled upgradient well data through November 2020 for Appendix IV parameters with a target of 95% confidence and 95% coverage to determine the background limits. When data did not follow a normal or transformed-normal distribution, nonparametric upper tolerance limits were constructed and the confidence and coverage levels are dependent upon the number of background samples. These limits were compared to the Maximum Contaminant Levels (MCLs) and CCR-Rule Specified Levels in the GWPS table following this letter to determine the highest limit for use as the Groundwater Protection Standard (GWPS) in the Confidence Interval comparisons.

Confidence intervals were then constructed on downgradient wells using data through November 2020 for each of the Appendix IV parameters using the highest limit of either the MCL, CCR-Rule Specified level, or background as discussed above. Well/constituent pairs containing 100% nondetects were not included in the analysis. A summary of those pairs follows this letter. Only when the entire confidence interval is above a GWPS is the well/constituent pair considered to exceed its respective standard. Several exceedances were noted. A summary of the significant results follows this letter. Note that Southern Company Services, reportedly, submitted an Alternate Source Demonstration (ASD) for the barium and combined radium 226 + 228 confidence interval exceedances.

Thank you for the opportunity to assist you in the statistical analysis of groundwater quality for Plant Watson Ash Pond. If you have any questions or comments, please feel free to contact me.

Prediction Limit
Interwell Non-parametric

Non-parametric test used in lieu of parametric prediction limit because the Shapiro Wilk normality test showed the data to be non-normal at the 0.01 alpha level. Limit is highest of 30 background values. 26.67% NDs. Annual per-constituent alpha = 0.03673. Individual comparison alpha = 0.001869 (1 of 2). Comparing 10 points to limit.

Re: Plant Watson Ash Pond
Statistical Analysis – March 2021

Dear Ms. Parker,

Groundwater Stats Consulting, formerly the statistical consulting division of Sanitas Technologies, is pleased to provide the statistical analysis of data for the March 2021 sample event for Mississippi Power Company's Plant Watson Ash Pond. The analysis complies with the federal rule for the Disposal of Coal Combustion Residuals from Electric Utilities (CCR Rule, 2015) and follows the USEPA Unified Guidance (2009).

Sampling began for the CCR program in April 2018 for wells listed below except newer background wells APMW-11 and APMW-12, and downgradient well APMW-1R which is a replacement well for well APMW-1. Historical data for APMW-1R was aliased with its corresponding well APMW-1. Sampling began at wells APMW-11, APMW-12, and APMW-1R in March 2019. Additionally, sampling began in April 2019 for downgradient well APMW-6R which is a replacement well for APMW-6. Historical data from APMW-6 were aliased with its corresponding well APMW-6R. At least 8 background samples have been collected at each of the groundwater monitoring wells.

The monitoring well network, as provided by Southern Company Services, consists of the following:

- **Upgradient wells:** APMW-11, APMW-12, APMW-13, APMW-14, APMW-15, and APMW-16
- **Downgradient wells:** APMW-1R, APMW-2, APMW-3, APMW-4, APMW-5, APMW-6R, APMW-7, APMW-8, APMW-9, APMW-10

- **Delineation wells:** APMW-2D, APMW-3D, APMW-4D, APMW-5D, APMW-6D, APMW-8D, and APMW-10D

New upgradient wells APMW-13, APMW-14, APMW-15, and APMW-16 were first sampled in July 2020 and currently have a maximum of 3 sample events. As requested by Southern Company Services, upgradient wells with 2 or more samples will be incorporated into statistical analyses.

Additionally, sampling at the following delineation wells listed below began in July 2020:

- **Delineation wells:** APMW-2D, APMW-3D, APMW-4D, APMW-5D, APMW-6D, APMW-8D, and APMW-10D

While data for these wells are plotted on the time series graphs, no formal statistical analysis is included in this report due to the limited data. When a minimum of 4 samples is available, these wells will be evaluated using confidence intervals for the Appendix IV constituents.

The CCR program consists of the following constituents:

- **Appendix III** (Detection Monitoring) - boron, calcium, chloride, fluoride, pH, sulfate, and TDS
- **Appendix IV** (Assessment Monitoring) – antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, combined radium 226 + 228, fluoride, lead, lithium, mercury, molybdenum, selenium, and thallium

Time series plots and box plots are included for all constituents at upgradient and downgradient wells. The time series plots are used to initially screen for suspected outliers and trends, while the box plots provide visual representation of variation within individual wells and between all wells.

Data at all wells were evaluated in during the background screening conducted in April 2019 for the following: 1) outliers; 2) trends; 3) most appropriate statistical method for Appendix III parameters based on site characteristics of groundwater data upgradient of the facility; and 4) eligibility of downgradient wells when intrawell statistical methods are recommended. Interwell prediction limits were selected as the most appropriate statistical method to evaluate the Appendix III parameters at this site. Power curves were submitted at that time and demonstrated that the selected statistical methods for Appendix III parameters comply with the USEPA Unified Guidance. The EPA suggests the selected

statistical method should provide at least 55% power at 3 standard deviations or at least 80% power at 4 standard deviations.

During this analysis, all upgradient well data were reviewed for any new outliers in existing and new wells using the time series graphs. No additional values were flagged as outliers in existing upgradient wells, and none were flagged in the new upgradient wells due to the limited data at this time. It was noted that concentrations for boron, calcium, chloride, sulfate, and TDS in the new upgradient wells are similar across the new wells, but significantly higher than those observed in the existing upgradient. Further studies beyond the scope of this analysis would be needed to fully understand the groundwater population upgradient of the ash pond, and the appropriateness of pooling all upgradient well data for construction of prediction limits. The assumption, however, is that pooling all upgradient well data results in statistical limits that are representative of the entire background population and will serve to balance the false positive risk (identifying a problem in a downgradient well when none exists) with the false negative risk (not identifying impacts when they exist in a downgradient well).

Evaluation of Appendix III Parameters – March 2021

Interwell prediction limits, combined with a 1-of-2 resample plan, were constructed for all Appendix III constituents--boron, calcium, chloride, fluoride, pH, sulfate and TDS--using all available upgradient well data to develop background limits. The most recent observation at each downgradient well is compared to its respective background limit during each subsequent semi-annual sampling event.

In the event of an initial exceedance of compliance well data, the 1-of-2 resample plan allows for collection of one additional sample to determine whether the initial exceedance is confirmed. When the resample confirms the initial exceedance, a statistically significant increase (SSI) is identified, and further research would be required to identify the cause of the exceedance (i.e. impact from the site, natural variation, or an off-site source). If a resample falls within the statistical limit, the initial exceedance is considered to be a false positive result and, therefore, no further action is necessary.

During the background screening conducted in April 2019, Tukey's box plot method was used to screen for outliers and the findings were submitted at that time. Background (upgradient) well data were re-assessed for potential outliers using time series plots during this analysis. Although no new values were flagged for Appendix III parameters, the highest sulfate value in upgradient well APMW-13 will be re-evaluated during the next event and marked as an outlier if concentrations are not similar to that measurement. When any values are flagged in the database as outliers, they are plotted in a

disconnected and lighter symbol on the time series graph and the accompanying data pages display the flagged value in a lighter font. A summary of flagged values also follows this letter. A substitution of the most recent reporting limit was applied when varying detection limits existed in data.

Parametric prediction limits are utilized when the screened historical data follow a normal or transformed-normal distribution. The confidence levels associated with parametric prediction limits are based on an overall false positive rate of 5%. When data cannot be normalized or the majority of data are nondetects, a nonparametric test is utilized where the highest background value is used to establish the upper prediction limit (and lowest value in the case of pH). The associated confidence level is dependent on the number of available background, future comparisons and resample plan. The distribution of data is tested using the Shapiro-Wilk/Shapiro-Francia test for normality. After testing for normality and performing any adjustments as discussed below (USEPA Unified Guidance, 2009), data are analyzed using either parametric or non-parametric prediction limits.

- No statistical analyses are required on wells and analytes containing 100% nondetects.
- When data contain <15% nondetects in background, simple substitution of one-half the reporting limit is utilized in the statistical analysis. The reporting limit utilized for nondetects is the most recent practical quantification limit (PQL) as reported by the laboratory.
- When data contain between 15-50% nondetects, the Kaplan-Meier nondetect adjustment is applied to the background data. This technique adjusts the mean and standard deviation of the historical concentrations to account for concentrations below the reporting limit.
- Nonparametric prediction limits are used on data containing greater than 50% nondetects.

When interwell prediction limits were constructed based on the interwell methods discussed above, several statistically significant increases were identified. Summary tables of the prediction limit findings follow this letter.

The Sen's Slope/Mann Kendall trend test was performed on wells/constituents with prediction limit exceedances. Existing upgradient wells were included in this analysis for a general comparison of how the groundwater behaves upgradient of the facility relative to downgradient. The trend test requires a minimum of 5 samples; therefore, wells APMW-13, APMW-14, APMW-15, and APMW-16 were not included. A summary of these findings follows this letter. When the entire record of data was evaluated, the following statistically significant trends were identified:

Increasing:

- Boron: APMW-12 (upgradient) and APMW-1R
- Calcium: APMW-1R
- pH: APMW-10

Decreasing:

- Calcium: APMW-4
- pH: APMW-11 (upgradient)

Evaluation of Appendix IV Parameters – March 2021

For analysis of Appendix IV parameters, confidence intervals for each downgradient well/constituent were compared against corresponding Ground Water Protection Standards (GWPS). GWPS were developed as described below. Well/constituent pairs that have 100% non-detects or trace values below the reporting limits do not require analysis and a list of 100% non-detect well/constituent pairs follows this report. Data from background (upgradient) wells for Appendix IV parameters are reassessed for outliers during each analysis. No new outliers were flagged and a summary of flagged outliers follows this report.

Parametric upper tolerance limits were used to calculate background limits, when data followed a normal distribution, from pooled upgradient well data for Appendix IV parameters with a target of 95% confidence and 95% coverage to determine the background limits. When data did not follow a normal or transformed-normal distribution, nonparametric upper tolerance limits were constructed and the confidence and coverage levels are dependent upon the number of background samples. The tolerance limit for combined radium 226 + 228 used nonparametric methods in order to generate a statistical limit that was conservative from a regulatory perspective. These limits were compared to the Maximum Contaminant Levels (MCLs) and CCR-Rule Specified Levels in the GWPS table following this letter to determine the highest limit for use as the Groundwater Protection Standard (GWPS) in the Confidence Interval comparisons.

Confidence intervals were then constructed on downgradient wells for each of the Appendix IV parameters using the highest limit of either the MCL, CCR-Rule Specified level, or background as discussed above. Only when the entire confidence interval is above a GWPS is the well/constituent pair considered to exceed its respective standard. Several exceedances were noted. A summary of the significant results follows this letter. Note that Southern Company Services, reportedly, submitted an Alternate Source Demonstration (ASD) for the barium and combined radium 226 + 228 confidence interval exceedances.
